Many people think that because Photoshop is so powerful it can do anything. That is untrue, and it has limitations. Consider this example of a fairly standard image-editing sequence. A professional photographer wanted to alter the background in a picture so that a young woman's head would stand out more. The image was to feature the young woman's head in the middle of a gold frame and was to be used in a weekly magazine. This image is positioned in the frame at in Figure 7-2. **Figure 7-2:** This frame is featured in a small advertisement, standing to the left of a banner on the front of the page. Photoshop's Composite feature is the way to alter this image to center the head. This composite is created at . The advantage of a composite is that it makes the composite into a new layer. The composite of course doesn't include the frame, which is still a separate layer. Both layers are visible at . Here, the composite and frame layers are positioned at the top of the layer stack, and the entire composite layer is shown at . It can be seen that the composite layer has already been created and contains a yellowish background. All this is done in a single layer. When the composite layer is made into a new layer, the actual background from the original image is replaced with a new background. A set of four masks is created and applied so that only certain areas are revealed. By using the Object Selection tool (O), areas of the background can be selected for cloning. A clone layer of the background is created and moved to the bottom of the layer stack . The selected area of the background is moved to the composite layer . In addition, the yellow background is replaced with a new background. The composite layer's background has been replaced because the settings in the mask is set to reveal only the yellow color — the background. The rest of the image is completed at . The head is aligned with the frame in the center of the image, making it easier to alter the background. Altering is done in the Layer Property Settings area, and is shown at . In the Layers panel, the composite layer is shown at , and the composite layer's Properties panel is shown at . The composite layer is a bitmap layer — a bitmap being a file type in which the pixel values represent what color is where. Bitmap layers are typically used for things like line drawings or simple photographs.

Black Mirror Cast Dissatisfied With Netflix's Entire 'Black Mirror' Series After production on the eight episodes of Black Mirror's fourth season officially wrapped in July, the show's staff tweeted that there was still work to be done. And now, Netflix has finally announced the set of episodes that will comprise Black Mirror season 5. The announcement comes after Netflix debuted the first two episodes of season 5 on Friday night, featuring the episodes "Nosedive" and "San Junipero." As with the four previous seasons, the episodes were written by longtime Black Mirror writer and creator Charlie Brooker. The series revolves around the melancholic existence of Black Mirror's characters, exploring themes of social media, artificial intelligence, and humanity's predilection for technological development and artificial distractions. It's a black-humored look at the social implications of technology and human behavior as a whole. With only eight episodes, it's a small jump between seasons, but after the tumultuous production of season 4, the whole series' staff is feeling a little wistful. "I can finally say I'm good with how Black Mirror is ending (with season 5) and that's it. Just finally. It's the end of the line," writer of the fourth season, Joe Cornish, told The Hollywood Reporter about the new season. "It's the end of the road for the set," John Burnside, who directed episodes 4 and 5, added. "I love that we are going out on a high, creatively." "I just cannot believe there are just eight episodes. What will I do with the rest of my days?" says actor Angus Macfadyen about the new season. Producer Annabel Jones was equally troubled by the decision, especially since it means the full 15 episodes won't be streaming. The Netflix streaming service announced a deal with Brooker last year for a live-action adaptation of Black Mirror, but the deal fell through. "It's very strange," Jones tells THR. "This is the first time we've not had the chance to stream these to our audience. I'm so sad. It makes the series feel like a retrospective thing and it's not what I was signing up for." There is a glimmer of hope to save an official season of Black Mirror, however. Brooker tells THR that the best way to bring Black Mirror back is to do a season of six or seven episodes, whether it's

1. Field of the Invention The present invention relates to hand grips for climbing assist devices and more particularly to an adjustable grip for an assist device that may be both lengthened or shortened so that the necessary level of support for the hand grips may be changed. 2. Description of the Prior Art A wide variety of human assistance devices have been developed in the last few decades. Such assistance includes devices for climbing walls, ladders, and the like. Such devices have also been designed to suit particular applications for particular persons. The devices include not only hand grips to be grasped by the person climbing the device, but also a myriad of designs for these grips. The grips allow the user to have a firm grip on the climbing device and make it easier for the user to ascend and descend the device. The grips can be designed to be both stationary or moveable during use. The grips may be designed to be longer or shorter based on the need. A first problem with any assist device is that of the hand grip length. The user often cannot find a grip that is long enough, nor can the user find a grip that is long enough at the angle required for climbing. Another problem with the prior art is that the grips must be larger for climbing applications than they are for sitting or resting applications. For example, grips found in gymnasiums are usually too large to be used by a user. In addition, the grips are static and the user cannot adjust the grips for the desired length to be used. Accordingly, an object of the present invention is to provide an adjustable hand grip for an assist device that can be lengthened or shortened to suit the particular application. Another object of the present invention is to provide an adjustable hand grip that can be lengthened or shortened while the assist device is in use. Still another object of the present invention is to provide an adjustable hand grip having an adjustable length with the assist device. Valerie Velazquez Over the last few years, I have written several articles about the systemic nature of what is commonly called "bias-based discipline." We've discussed how discipline can be "shame-based," "hate-based," "exclusion-based," and all of these "should" on top of "don't"s ("don't" with a variety of other "shoulds").
