===== Capivara is a lightweight filemanager for Java, but with more features than ordinary file managers. You can choose to copy or move files locally or to an FTP server. If the file is being copied to an FTP server, you can choose to compare the last modified times. If this is not set to "never" the file manager will always compare the SHA-1 hash values. By setting the option "preview mode" to "on", you can see which files are going to be deleted or copied. Features: ===== * Copy and move files locally or to an FTP server. * Compare timestamps. * Select file by "Open...", "Folders and Files" or "Imports and Exports" to create a 'packages.txt' file. * Compare sha1 hash values of files. * Import and export packages using the app "Packageimport". * Search files and find filename patterns. * Import pictures. * Create new folders. * Supports WinSCP config file to connect to an FTP or SFTP server. * Change the main window title. * Capivara Pro: with much more features. * Advanced: support for the latest Java 7. * Lazy loading of the main window: Capivara does not load the main window when you open a file from the sub folder. - It is faster and consumes less memory. - You need to go to the sub folder first and open the file directly. - But if the file is in the root folder, it is still faster because Capivara does not load the main window. * Share folders by entering the root password. ** IMPORTANT ** If you share the folder with the "share root password" you need to create another user with the same user password. You can create a new user by going to the "Manage Accounts" menu. Choose the account type "Other" and choose "Password Require." New user will be created and set as the active user. But the password will be set to the root password. So if you want to share the root password you need to change the account password. If you are the root user you don't have to do anything. If you are not the root user you need to

change the password by clicking on the "Users" menu and entering the password. Don't forget to enter the root 09e8f5149f

What's New in the Capivara?

Capivara is a Java-based two panel file manager with support for FTP and SFTP servers. Capivara is not an ordinary file manager because it adds synchronization features like comparing timestamps or SHA-1 hash values. The synchronization of Capivara has a preview mode to shows which files are going to be deleted or copied. The preview is a workspace with the current files of the FTP server directory. You can do these preview features as root, or with the superuser's privileges. When the FTP server is over a SSH tunnel, you can preview the changes directly in your terminal window. Capivara Keys: Capivara is well known and used around the world, but many of its features are not known. Capivara is not an ordinary file manager because it adds synchronization features like comparing timestamps or SHA-1 hash values. Other information Capivara supports hosts like : /etc/passwd, /etc/shadow, /etc/group, /etc/hosts, /proc, /etc/resolv.conf and other configuration files are well supported (for more informations check the infos about Capivara Features) Capivara Configuration Preferences Capivara has a configuration file that you can edit to make your preferences. Preference categories: File Manager Preferences Capivara supports FTP, SFTP, SFTP over SSH and FTP over SSH tunnel (via a SSH server). (When Capivara is connected to FTP over SSH tunnel, you can edit the files with root privilege, that's why you have to be root for editing this file.) In the default configuration of Capivara you will find this list of the FTP servers that you have installed: File Manager Preferences Options: Whether to show the file name in the preview mode (not for FTP) Whether to be able to open files from the preview mode (not for FTP) Limit the showing files to 5 by 5 (not for FTP) A fixed path for viewing, in case the path is empty, it will use the default "capivara" folder. Whether to be able to read the file's.properties (see explanation in this entry) Whether to be able to read the file's content (only for SFTP, not for FTP). How to display symbol dashes in the file names (only for FTP) Do not use any file manager context
