**\*\*Create a New Color Project\*\*** Photoshop Elements enables you to create new color projects without having to rescan your image. All you have to do is open the file and use the new Project palette. You can't add project tabs or rearrange the tabs that are already there. You'll see how this works on your first project.

1. **\*\*Open the File\*\*** : From the File menu, select Open. Then choose the file or folder where you want to store the project.
2. **\*\*Select a Color Project\*\*** : Your file opens in the new Project palette. In the `_Project Types_` group, there are four projects: Baseline, Color, Grayscale, and Transparency. In addition, there is the recently added Photo Collage. If you used the Photo Collage project, then the new project can't be

opened. You need to reopen the file.

It may be difficult to find a good deal on Adobe Photoshop Elements. One way is to work your way down the price ladder. You can find a great deal if you're willing to be selective. For example, you can get Adobe Photoshop Elements 2018 for \$29.99. If you're not sure which version of Photoshop Elements to get, you can compare these versions. For better success, you should use a deal online, rather than a buy-now-and-return deal from a brick-and-mortar store. A buy-now-and-return deal is like getting a bargain, but when you purchase a printer online, you often have the option to return it if you find a better deal elsewhere. You can also visit Ebates to get cash back from online deals.

New pelvic vascular anatomy for the creation of reliable vascularized bone transplants. When using vascularized bone transplants, a great deal of attention is paid to preserving the donor vessels. Unfortunately, the actual anastomosis can fail because of the many unusual configurations of the donor vessels at the bone-periosteum level. To avoid this complication, we studied the anatomic features of the periosteal vasculature, which allowed us to provide reliable, predictable results with minimal technical challenges. Using a 5 x 0.5-mm microsurgical saw, the venous periosteum was peeled away from the base of the epiphysis. At the level of the epiphyseal canal, the periosteum was elevated by 4 to 6 mm and then freed from the osteochondral surface. This maneuver

exposed the subchondral vessels lying proximal and distal to the articular cartilage, which ran in the subchondral plate. Fourteen adult cadaveric tibiae were dissected. The axis of the epiphyseal canal was measured, and the vascular anatomy was characterized by confirming the presence of either the lateral or medial circumflex femoral artery or both. The level of the vascular pedicle to the donor bone was defined and a microsurgical probe was used to identify the anatomic features of the donor periosteal vessels. The course of the periosteal vessels proximal and distal to the articular cartilage was delineated. The medial or lateral circumflex femoral artery was identified at a mean distance of 5 mm distal to the joint line. At that level, the vascular pedicle was found to be at the junction of the common femoral vein and the superficial femoral

---

vein, and was oriented longitudinally. Further from the joint line, the periosteal vessels ran parallel to the joint line and then cut across the epiphyseal canal perpendicular to the osteochondral surface. The periosteal vessels are exposed when the vasculature is freed from the bone in the location of the donor site, specifically, the level of the epiphyseal canal. The proximity of the periosteal vessels to the epiphyseal canal and joint line allows for more reliable pedicle matching and use of a preferred periosteal vessel., no charge for travel, board, lodging and meals are provided. class C3 extends B3 { double g(int x) {

any one understand it? A: It means, you have  
"super classes" that are abstract, which is the  
case that you don't have any concrete  
implementation for them. This mean that  
they don't have any implementation for all of  
the methods they have, only some of them.  
In this example, f can be overwritten in the

child classes (and only that), but g can't. Is not clear how it can be used. A1 can have all its methods, A2 can have one and B2 can
