Top of page AutoCAD users can interactively control drawing commands by clicking, double-clicking, and typing. Command-activated menus and toolbars provide access to the various commands and subcommands. These menus and toolbars can be customised by creating custom profiles. AutoCAD history

AutoCAD began with the development of the "AutoCAD

---

Graphics and Character Systems" product line. This was a powerful bitmapped graphics system which allowed the user to draw, manipulate, and display a 2D representation of a 3D space (building, model, etc.). The 2D drawing could be saved as an image file to retain the 3D look, or imported into an AutoCAD drawing for the creation of 2D drawings from 3D models.

Graphics systems evolved into several systems which enabled

---

the AutoCAD user to generate and edit features, text and images. In 1987, a desktop publishing system, AutoCAD Rastersystem, was released. This included raster graphics-capable plotting and imaging tools which generated and edited image files. A related product line was released as AutoCAD Imaging and Graphics Systems (1988) which included AutoCAD-compatible image files in a binary format. In 1990, the

---

design capability for AutoCAD was expanded to include architectural and interior design applications. The drawing and modelling capability, developed since the AutoCAD Graphics System was first released, was also included. The architecture and interior design application is now known as AutoCAD Architecture. This was followed by AutoCAD Mechanical, a mechanical design tool, in 1994. In the early 1990s, the

---

Architecture system expanded to include design applications and project lifecycle management. Design applications were initially released as AutoCAD 2000, AutoCAD 2000 Architecture, and AutoCAD 2000 Mechanical. A project lifecycle management application was released in 1995 as AutoCAD 2000 Project Manager. AutoCAD Architecture AutoCAD Architecture was released in 1990 as a feature-rich drafting

---

tool, designed for the creation of architectural drawings, and was renamed AutoCAD Architecture in 1994. Architecture allows the designer to interactively control 2D and 3D drawing options, image editing, text display, and annotation tools to create professional-quality architectural drawings. Autodesk released AutoCAD Architecture in September 1990, when AutoCAD was still called AutoCAD Graphics and

Q: Generate PDF documents from text files using LibROSA  
I am trying to generate PDF documents from text files using LibROSA. I can generate PDF documents from multiple files in a folder using the pdf module. But I am not able to find any

---

documentation regarding generating PDF documents from text files. I am using the following command to generate PDF documents from text files

```
rosa -o /home/sf/Desktop/pdfs/Sample.pdf /home/sf/Desktop/sample.txt
```

The folder structure is as follows. /home/sf/Desktop/pdfs/sample.txt pdfs/sample.pdf Can anyone help me on this? A: The pdf module will output a PDF document containing all of the

---

content from the input file.

There is no direct way to output a PDF document containing only some of the content from an input file. If you want to output a PDF document containing only some of the content from the input file, you will have to output the contents of the input file, combine them with other documents into a single PDF, and then output the resulting document. Here is an example of doing that: `#!/usr/bin/env bash`

---

```
tmpDir=`mktemp -d` || true rm
-rf "$tmpDir" trap 'rm -rf
$tmpDir' EXIT cd "$tmpDir" ||
true mkdir -p pdfs mkdir -p
$tmpDir/pdfs/output"
inputFile=${1%/*} a1d647c40b
```

Software community. The only sane thing he can say is 'I'm glad you're using software that doesn't infringe your rights'. That's about as far as that point can be taken before you end up in a 10-round fight that might not even go the distance. If you want to hear from Torvalds, you can just listen to what he says or his posts. In other words, if he wants to take you to court, let him. use your software. If he doesn't want to go to court, he'd better start looking for a community lawyer and start filing all his cases. The only sane thing he can say is 'I'm glad you're using software that doesn't infringe your rights'. I would disagree that Torvalds has a good reputation for this. His attitude to FOSS could be described as 'happy to accept money for his software, but nothing more' In other words, if he wants to take you to

court, let him. Otherwise, he's just inviting the rest of us to take your money and use your software. If he doesn't want to go to court, he'd better start looking for a community lawyer and start filing all his cases. Torvalds said that he didn't care about other FOSS users, which is what led to him leaving Linux. He said that FOSS was about building an industry that could pay him, and that he didn't need a community, so why should he care? Now

you're being completely silly with your attitude, and that's not the point of what I'm responding to. ...In other words, if he wants to take you to court, let him.
