Computer-Aided Design The main features of computer-aided design in AutoCAD are, among others, in order of appearance: Drawing objects: The user can draw geometric shapes by means of a standard, user-friendly mouse. Geometric and dimensional tools: The user can modify the drawing objects with standard commands. 2D Drafting tools: The user can draw lines and arcs to create linear and curved paths, and can modify the dimensions and properties of these objects. 2D Drafting & Dimensions tools: The user can rotate, scale, mirror, stretch, and otherwise modify the drawing objects using standard commands. Dynamic editing tools: The user can modify the properties of existing drawing objects by double clicking on them. Themes and view modes: The user can choose the color and style of the drawings that can be applied to a drawing. The styles of the drawings can also be modified. Scaling: The user can scale the drawings to fit in any selected area. Point-and-click menu: The user can select any drawing object by clicking with the mouse. Supports basic editing: The user can insert and delete selected drawings. Supports basic drawing commands: The user can insert lines, arcs, and arcs or rectangles. Support basic 2D drafting tools: The user can draw arcs, rectangles, lines, splines, splines or other arcs and lines and edit their dimensions. Supports basic 3D dimensions: The user can add 3D drawings to a drawing, move them, change their dimensions, and edit their properties. Supports basic 3D objects: The user can add 3D solids, freeform 3D drawings, and convert 2D to 3D objects. Supports basic 2D modeling: The user can create 2D drawings in freeform. Supports basic 2D text: The user can create text and edit its properties. Supports basic 2D annotation: The user can add text, symbols, and annotation to a drawing. Supports basic 2D dimensioning: The user can add dimensioning to a drawing. Supports basic 2D presentation: The user can add presentation to a drawing. Supports basic drawing management: The user can place drawings and modify the order of placement. Supports basic 2D editing: The user can edit the properties of 2D drawings. Supports basic 3D editing: The user can edit the properties of 3D solids, freeform 3D solids, and objects. Supports 5b5f913d15

High-accuracy single-channel implantable microphone for sound- and vibration-detection applications. A high-performance implantable microphone device is presented. Its individual components, such as the speaker membrane, the resonator, the membrane-bump piezoelectric layer and the piezoresistive layer, are all integrated in a single silicon chip. The microphone achieves a high input-rejection ratio of 98 dB and a full-scale nonlinearity of 0.6 dB. The resonator is made with multi-layer rings of piezoelectric material. The voltage of the membrane depends on the thickness of the piezoelectric layers. By utilizing the membrane-bump piezoelectric layer and the piezoresistive layer to the top and bottom electrodes, respectively, the positive potential at the membrane is improved. The fabrication process is compatible with advanced 0.35- $\mu\text{m}$ -CMOS technology, resulting in a low price, and the total cost of the device is under \$20. The microphone device has been tested in a standard lab environment, in the ear canal, and under free-field conditions. The output sensitivity is 54 dB re 1 Vrms, and the noise level is approximately -96 dB re 1 Vrms. It is also shown that the peak-to-peak voltage of the microphone signal is higher than 100 Vpp for 1 V signal at a distance of 1 cm from the microphone membrane. Engineers at James Cook University (JCU) in Australia have unveiled their miniaturised laboratory, which is capable of being used for genetic engineering purposes. The micro-lab, which has been named the 'Genesis Microplate', is capable of conducting up to 25 experiments simultaneously in a 10 litre volume. Engineers from JCU's Division of Microsystems and Devices (colloquially known as 'the Micros') have created it to
