- Digital Simulator is a VHDL front end for PCI bus simulation and is a powerful tool for digital design of full-size PCI buses, especially for design of high speed networks. - Digital Simulator is a graphical front end for PCI bus simulation and is a powerful tool for digital design of full-size PCI buses, especially for design of high speed networks. - Digital Simulator can perform detailed analysis of your design in real time, for example: - can check the boundary conditions for timing and faults - can diagnose potential timing or logic errors in the VHDL source code - can simulate the actual design and evaluate the effect of synthesis - can simulate with arbitrary values of a key signal - can simulate the entire design including all components - can generate a library with C code for a verilog code synthesis The circuit editor in Digital Simulator is very similar to the one found in Altera Quartus. Digital Simulator supports: - VHDL files - HEX files - Waveform generator - bus capture/tracer - simulation - high speed emulation - component libraries - cycle accurate timing analysis Digital Simulator is a GPLv2+/LGPLv3+ free software. Please see the documentation for more details. A Digital Simulator package is a version containing only the simulator, and no tools for VHDL/VHL conversion. Please note that a Digital Simulator is not the same as an Altera Quartus product. What's New in the Digital Simulator?

Digital Simulator is an easy-to-use application that allows you to sketch a PCB layout using a toolbar of digital circuit elements, including flip-flops, logic gates, switches and indicators. Drawing a circuit with Digital Simulator is like using a paint program. You click the element's icon on the toolbar, then click where you want the element to go. You use a similar procedure to draw wires and indicate connections. Note: Free for students and educational institutions. You can use a mouse to click on objects or use the arrow keys to move the cursor around. You can double click to select objects or place new objects in the simulation box. Digital Simulator does not need to be calibrated to measure distance and velocity. However, if you want to make sure you have the exact dimensions of a board, you should be able to use a slide rule. Digital Simulator is fully integrated with Simulink. You can control the simulation and view results in the same window. Download the latest version of Simulink from the downloads page.
