A: One of our customers has described this process. Here is a diagram of how the user's application is handled through Voxeo VoiceObjects. In the traditional 1) User designs and builds the VoiceXML application 2) User sends application to Voxeo and builds it in Voxeo's cloud based environment. 3) Voxeo reviews the application and sends a deployment certificate to the users' software which enables the users to deploy application on his/her hardware. 4) User can then upload the configuration file and can test the application on Voxeo's test environment. 5) User's support can engage with customer support team on Voxeo's infrastructure. 6) User can test his/her application in the live environment. This model is a good example of how voiceXML is deployed and operates. It's a deployment and release management tool

Enterprise Application Express (APEX) is a development tool. This tool is designed to assist front-end developers in creating interactive web applications without the need to write any Java, SQL or XML scripting code. It is delivered as a ready-to-use, fully-compiled product from Oracle, unlike many other Ajax products that are designed to work on a per project basis. I'm also developing this app using RADPHP. Its target is to be deployed on the Google App engine which it's free but there is a limit for free users (they can be large applications) and it's also pretty slow but we may not need a large amount of memory so it could be fine with the free version. Have you heard about GoGrid, AppFog, Engine Yard and other virtualization products (like OpenShift) that give you a self-service platform to host and manage applications, including servers, databases, messaging and storage, in the cloud? I'll try to use these services for my application, they're great for that. You can have many servers on a Virtual Machine using a simple interface or you can have thousands of servers on a single Virtual Machine and pay as little as \$0.02/month/server. So the prices are very very low compared to the Apache Software, Amazon, etc. Hope this information is useful. Developers Continue to Wonder If 'Pulp Fiction' Was the Right Choice for New Orleans Last fall, a New Orleans-based developer unveiled a project that he says could be New Orleans' next landmark: a 60-story skyscraper that resembles a martini glass. The \$US270 million (\$A390 million) tower would include 1,009 apartments and lofts, 5,000 square feet of ground-level retail and a roof deck with sweeping views of Lake Pontchartrain, Lakeview, the French Quarter and the Superdome. It would be the tallest building on Canal Street, the hub of New Orleans' business district. But Christopher Rohr, the New Orleans developer who sought out the martini shape to lure tenants, has encountered opposition from some quarters. "People have said to me, 'Why do you want to develop in such a unique part of the city?' and 'Why do you need 1,000 apartments?'" Mr. Rohr said in an interview. The developer said he is confident about New 09e8f5149f

VoiceXML's text-based development paradigm is used to build, deploy and run applications that can be spoken, such as IVR or interactive voice responses. VXML is intended to enable the creation of very powerful applications in a cost-effective manner, and it is now supported by almost all leading IVR platforms. Voxeo VoiceObjects Developer Edition is based on the latest version of VoiceXML IVR standard - VXML 3.0, and contains the full specification, including the full text of the standard. This version of the standard is the latest release, and supports the latest generation of leading IVR platforms such as Genesys, Intervice and Nuance. The application development environment and the architecture provides a fast way to create new applications. It also contains a graphical interface to help users to visually develop and instantiate the application objects that the library contains. VoiceXML is an interpreted language, meaning it can be interpreted at run-time by the device on which it runs. Although it was originally designed to be only a runtime language, it has proven to be an excellent platform for building IVR applications. You can use all of the VoiceXML tags and parameter mechanisms. You can also add or remove event triggers, and plug in the calls from an external event/event manager. Q:
