Download GOM Player for Windows to experience the full benefits of. You can add custom audio EQ effects, tweak subtitle lengths, and even take burst. to run, just click apply and the subtitle will be automatically downloaded and applied.Q: why we use $\text{if}(\text{abs}(a) > \text{eps})$ One thing i learnt with the following code is that we use if statement to avoid the error $(a) > \text{nul}$ whereas, if we put everything in the function, then the compiler throws an error. Why is that? But if we do use the function, why do we not write like that? for $i:=1$ to 10 do begin if

(a)>eps then showmessage('a'=a) end A: Abs(A)>Epsilon is true when A is larger than epsilon, not when A is more than epsilon. That means, it is evaluated only at its first position, where A is equal to A, so its evaluated values are A and A. A: The reason why you would not want to do something like that is because the function will be evaluated when something is evaluated that it has an impact on. If the "something" is not evaluated then the other code will not have any effect. If A is greater than 10 then the loop will run, and the expression A will be evaluated, the loop will end, and something will happen, and the if statement will still be run. If no code in the if statement was affected by the results from the first evaluation then the results from the first evaluation won't be reflected in the results of the if. If A is less than 10, the same thing will happen. A will not be evaluated (the loop will end before it can be evaluated), and the if will still be run. If A is greater than f30f4ceada
