Portable RAMExpert is a straightforward application designed to provide a simple method of retrieving extensive RAM information. In addition to fetching RAM reports, the program also pinpoints empty RAM slots, encouraging you to upgrade your system in order to benefit from higher performance. It is the to-go version of RAMExpert, sporting the exact feature set as the latter; the only difference is that the portable version doesn't write to the system's registry (as opposed to the installer edition) and can be carried around on a removable drive and launched on any computer. Portable RAMExpert is very intuitive and comes wrapped inside a user-oriented interface, being fit for all audiences, regardless of the level of IT knowledge. Simply double-click the EXE file in order to launch it, then start exploring the report, which will be immediately fetched. The overview includes details such as number of slots, current vs maximum memory, as well as real-time stats of the amount of used RAM. The program detects the slots that are currently occupied and delivers several details, namely slot name, capacity, manufacturer, model, type and serial number. Extensive specifications can be retrieved by pressing the 'Get Specification' button corresponding to each slot. Portable RAMExpert also shows empty slots, suggesting upgrades by redirecting you to Amazon where you can purchase this type of hardware (however, this is simply a recommendation, since you can acquire RAM from wherever you want). In conclusion, Portable RAMExpert is able to provide essential RAM information that is necessary for any computer user who wants to keep an eye on resource usage and computer performance. A: No, but if you are using Ubuntu you can also use the appropriate tools. You can use the command "free" to know the current amount of available memory: free Q: Classification with Sparse Feature Matrix I want to train a SVM for classification with some parameters (weights and regularization). The problem is that I'm not really a machine learning guy and I'm not sure if I'm doing this in the right way. So, I've got a feature matrix with ~500,000 rows and ~25 columns (some are mostly 0 or 1). At the end of each epoch I have a partial solution where I backpropagate to each row in the feature matrix (with the current parameters) and then I apply softmax (to produce the final prediction). My question is: is this the right way to do the classification? Or should I just train the model
