It also uses vector-based editing capabilities and has a basic Illustrator-like tool called the Pencil tool that enables drawing in Photoshop. This chapter focuses primarily on the graphic design aspects of using Photoshop. Assessing Photoshopping Options and Tools Photoshop has a standard set of tools that are usually enabled when you start an image. These tools enable you to create, enhance, and manipulate an image on multiple layers and adjust its appearance with special effects, filters, and other tools. In addition to these standard Photoshop tools, it provides many other features that can be used to create, alter, and finalize images. It has a unique assortment of tools that make it a useful tool for picture-editing tasks. Among its unique tools, Photoshop has a selection tool that enables you to create objects (called selections) based on what is visible in the image. It also has tools that allow you to draw in the image. Some of these tools have special functions, such as an eraser tool that allows you to selectively remove portions of an image. You can also convert an image into a selection, which is useful when you want to make small changes to an image or to create additional layers within an image. You can use the selection tools to resize or crop the selected portion of an image. A good understanding of the selection tools can help you create more effective images. Although Photoshop has lots of specialized tools, you can do most of the typical image-editing tasks on your computer using the standard tools provided by the operating system. If you are new to using Photoshop, start with the basics and gradually learn more complex tasks. Most of Photoshop's special effects and image-manipulating tools require some training to use effectively. Photoshop's tools are covered in more detail in Chapter 4, and the Pencil tool is covered in Chapter 12. Photoshop also includes numerous plug-ins, which are small special programs that add additional functionality to Photoshop. For example, you can use a special brush-control plug-in to allow you to create and customize brushes. Another plug-in lets you choose the pen tool preset. Using Layered Layers If you've done any kind of graphic design or photo editing, you've most likely learned and used Photoshop's layered feature. Using layers allows you to create separate layers with different colors or shapes. Each layer can have a unique appearance and can be used to show the background of an image as well as the

Q: How to communicate between native application and phonegap application I need to communicate between native application and phonegap application, How can i do this? By using some native jar files of phonegap application? How can i achieve this? Is it possible? A: From what I understand you would like to do something like this: Send an action from the native app to the PhoneGap app and have it respond. First step, the native app needs to implement an interface. For example: public interface IAppAPI { void dispatchTouchEvent(String action, JSONObject args, Map argMap); } Step 2, for the PhoneGap app to implement this interface: public class PhoneGapClass extends DroidGap implements IAppAPI { .... @Override public void dispatchTouchEvent(String action, JSONObject args, Map argMap) { ... } } Step 3, from the native app: IAppAPI api = (IAppAPI) this.getSystemService("appapi"); api.dispatchTouchEvent("myapp_action", new JSONObject(), new HashMap()); The advantage to using this approach is the native app won't have to make any HTTP requests. Q: Why set type of a variable to another type of another variable? I have tried looking at the setter and getter of a class in java for that class but I did not understand why it is happening. Suppose I have class A and I want to set/get type of a variable to class B, why would I do it like below? public class A { public A(int m) { number = m; } public int getNumber() { return number; } public void setNumber(int n) { number = n; } } and public class B { public A a = new A(2); public void setA(A o) { a = o; } public A getA() { return a; } } A: It is a type of convenience. A and B are not exactly the same type but have the same fields so you can assign them to each other. We usually create getter or setter method as explicit conversion for other kinds of objects but this is kind of nested in the class A. When you declare a setter method then JVM will not allow the assignment of other class than a to this field. There is another way to achieve it without making a setter method public class A { public A(int m) { number = m; } public int getNumber() { return number; } // avoid making assignment to number this way public void setNumber(int newNumber) { this.number = newNumber; } } Q: Constant id_element in a fieldset with class select-wrap I have a fixed fieldset where I am populating its values in my view template. The fieldset has the following id: id="
