Users may have experienced Photoshop and Elements on the same computer because both are graphical, and both allow users to edit photos, create new high-quality photos, and make backgrounds. Photoshop is an application that allows the user to edit images, create new images and save or make printable copies. This tutorial is going to help you learn Photoshop, elements for beginners by using the following information: 1. The basics of Photoshop: 2. The keyboard shortcuts: 3. The key functions of Photoshop 4. Using Photoshop like a professional: 5. Editing images in Photoshop: 1. The basics of Photoshop: Photoshop can be purchased for use as a stand-alone program or for use in conjunction with a graphic tablet. It is the software used by most photographers and photo editors. A tablet allows the user to "trace" lines, draw shapes, and modify shapes on a photo to create new imagery or effects. 2. The keyboard shortcuts: In order to learn Photoshop, it is recommended to use the keyboard to navigate your way around the software. Photoshop uses a "Zoom In" and "Zoom Out" system that allows the user to zoom in and out of the program. The first step is to zoom to 1,200% which is how large the grid is. To "Zoom In" on your photo simply type "I" (as in "In") and then the percentage of how you would like to zoom in. For example, if you want to zoom in 5 times it would be "I 5" which would result in you zooming in 5 times. When you type "I," it will instantly zoom to the "Current Zoom Level" which is 100%. To go to the next level (200%) simply type "2" and so on. 3. The key functions of Photoshop What is Photoshop? It is a software package that helps the user create, edit or modify a picture. The edit functions of Photoshop allow the user to: 1. Rotate 2. Straighten 3. Crop 4. Resize 5. Zoom in / Zoom out 6. Change colors 7. Various effects 8 388ed7b0c7

Q: sqlite: how to get latest row I have a table with 2 columns, user_id and message_id. For a given user_id, I'd like to display the most recent message (or messages, or entries - whatever makes sense) The only bit of question I have is, is this method: SELECT user_id, message_id, message_time FROM messages WHERE user_id =? ORDER BY message_time DESC LIMIT 1 the best method? Will it work for multiple users, or will I have to do something like this? SELECT user_id, message_id, message_time FROM messages WHERE user_id IN (?) ORDER BY message_time DESC LIMIT 1 (Also, would it be possible to ORDER BY message_id in this case? I haven't actually tried that, and I don't think it would work, given that the order of messages can vary depending on how they are referenced in the code, but I thought I'd ask.) A: SELECT user_id, message_id, message_time FROM messages WHERE user_id =? ORDER BY message_time DESC LIMIT 1 Güssoskopf The Güssoskopf () is a mountain of the Schwyz Alps, overlooking Lake Walenstadt in the canton of Schwyz. It seems a kitschy bunny has decided the law isn't working and is jumping into everything. A rabbit was discovered doing a header on the floor of a Ministry of Justice building in Regina early this week, and a police officer acting on a tip last week entered a house in Eastend, Sask., where a person living there said a bunny would frequently attempt to headbutt him. While the first bunny was an accident, the second was a deliberate act. The Saskatchewan government wants to eliminate the Firearms Act — which has been in effect since

Q: Rails Active Record - Avoid multiple queries The application I'm working on uses a PostgreSQL database, and for some fields it has its own type, like width and height in the case of images. So there are some queries like this one: SELECT title, width, height, mid FROM posts I have about 30 of those queries, a typical result is something like this: { "title" => "A title", "width" => 50, "height" => 50, "mid" => 0001 } The good thing is that Rails is smart enough to avoid loading a new model instance when one field only changes. However, what if I want to avoid a second query for each field? I came up with the following solution, which is rather ugly. class Post has_one :image def update_row begin new_width = self.width - 10 self.image = #a separate query here self.width = new_width self.save! end end end Is there a better way of handling this? I believe something like this should be unnecessary, as Rails should use the objects and update_attributes method to provide just the small changes to the data in one go. However, if a field isn't changed at all, a separate query must be performed, but even in this case the data just isn't changed, so a separate query is useless. A: You can use where: def update_row self.image = Image.where('width =? - 10', self.width) self.width = self.width - 10 self.save! end Note that you can't call save!, but you'll only receive an exception if you try to update an image with a non-existent ID. If you change the chain to def update_row self.image = Image.where('width =? - 10', self.width) self.width = self.width - 10 self.image.save! end you'll get a new instance of the Image class as a result instead. The idea is to chain the methods without calling any, and Rails will call
